

We build the way in.

A software studio **building for the world** — developing for the blind today, where the method is proven three times over: **AccessBridge** ships now, **FLSpeaks** is in active build, **OBSSpeaks** is feature-complete and entering testing. The same studio also ships professional audio tools and real client software, proof the craft reaches past accessibility. Flagship: AccessBridge — Serato DJ Pro & djay Pro, playable entirely by ear, in testers' hands today.

THE PROBLEM

2/124

SERATO ELEMENTS
A READER CAN READ

DJ software is built to be **seen** — waveforms, library, cues, effects. A screen reader gets almost nothing: of Serato's entire interface it can read just **2 of 124 elements**. Serato was screen-reader usable through version 1.7; the 1.8 interface rebuild broke that access, and Serato has never restored it. Virtual DJ's custom skinned interface is not compatible with screen readers; blind users depend on a third-party workaround, not native support. Talent was never the barrier — access was.

WHAT IT DOES

- **Reads the software from the inside.** Serato's live state directly — deck, time, key, BPM, cues, effects, crates; djay via the Mac's accessibility system. Read-only, no screen capture, no fake clicks.
- **Names the controller under your hands.** Every knob, pad and fader announces itself the instant you touch it — 200+ controllers, both hosts, zero setup.
- **Speaks, and drives.** One clean voice (can speak through the DJ's own screen reader) and drives back — load a track, set a cue, sort the library, jump a beat.
- **Tells the truth.** Nothing is guessed; if a value can't be read, it says so rather than inventing it — the trust a tool needs mid-set.

STATUS & PROOF

37,000+

lines of Swift / C++, shipped

719

automated tests, guarding
every claim

3

products: shipping, in build,
entering testing

djay + Serato

full parity across both, plus
Mic FX & streaming
accounts

Three doors, one method. **FLSpeaks** (in build) brings the bridge to FL Studio via MIDI-SysEx — 461 commands, 597 params verified live. **OBSSpeaks** (feature-complete, entering testing) patches OBS at the source — 35 patches, ~11,800 lines.

MARKET & THE MOMENT

2.2B

at least 2.2 billion people live with a vision impairment (WHO); ~43 million of them blind — locked out of the professional software the world runs on. Access is dignity and livelihood, not charity.

2025

The **European Accessibility Act** has been in force EU-wide since June 2025 (WCAG 2.1 AA); the US DOJ's ADA Title II rule sets the same bar, with large public entities due by April 2027 — amid 3,117 federal web-accessibility suits filed in 2025 alone, up 27% year over year.

\$31.22B

The assistive-technology market is forecast to reach **\$31.22 billion by 2030** — and disabled founders, up to 400% less likely to secure investment than peers, are the opportunity an investor moving first gets ahead of.

THE RAISE — \$450,000

\$450,000 · 18-month pre-seed, solo founder full-time — ships all three to a stable 1.0, on a comfortable, sustainable runway.

Founder runway · 18 mo		\$150K 33.3%
Contract engineering		\$90K 20%
Ship all three to 1.0		\$80K 17.8%
Hardware & test rigs		\$30K 6.7%
Accessibility QA & docs		\$30K 6.7%
Legal, launch & contingency		\$70K 15.5%

Covers: a real living wage, not a below-market stipend · contract engineering (~\$45K FLSpeaks, ~\$45K OBSSpeaks) · finishing all three to 1.0 (~\$20K AccessBridge, ~\$35K FLSpeaks, ~\$25K OBSSpeaks) · hardware across all three (~\$12K/\$9K/\$9K) · paid accessibility betas (~\$15K) · four trademarks (~\$7K), launch, and a real contingency reserve.

Already all-in — months unpaid, 44,000+ lines plus 35 patches, zero outside funding. \$450,000 is fuel for a fire already lit three times over — a family, not a cap table.

How it returns: direct licenses (43M blind / 2.2B vision-impaired), a paid pilot with the platform vendors, and in time a license or acquisition — into a \$31.22B market by 2030.
